Origin Story: The Big History of Everything is a book by David Christian that explores the history of the universe, from its origins to the present day. The book provides a comprehensive overview of the major events and themes in the history of the universe, from the Big Bang to the present day.

Christian argues that the universe has a single, coherent story that can be told. This story begins with the Big Bang, the moment when the universe

began. From the Big Bang, the universe expanded and cooled, and the first stars and galaxies formed. Over time, these stars and galaxies evolved and changed, and the universe became increasingly complex.

Christian's story of the universe is not just a story of physical events. It is also a story of life and consciousness. The first life forms emerged on Earth about 3.5 billion years ago. Over time, life evolved and became increasingly complex. Eventually, humans evolved, and we became the first species to develop consciousness.

Christian argues that the emergence of consciousness is a major turning point in the history of the universe. Consciousness allows us to understand the world around us and to make choices about our future. It also allows us to create art, music, and literature.

Christian's book is a sweeping and ambitious work that attempts to tell the story of the entire universe. It is a story of cosmic evolution, of life and consciousness, and of the future of the universe.

The Big Bang

The Big Bang is the moment when the universe began. It is thought to have occurred about 13.8 billion years ago. At the moment of the Big Bang, the universe was very hot and dense. It was so hot that matter could not exist. Instead, the universe was filled with a soup of subatomic particles.

As the universe expanded and cooled, these subatomic particles began to combine to form atoms. The first atoms were hydrogen and helium. These

atoms then combined to form the first stars and galaxies.

The Formation of the Solar System

The Solar System formed about 4.6 billion years ago. It began as a cloud of gas and dust. This cloud began to collapse under its own gravity. As it collapsed, it began to spin.

The spinning cloud of gas and dust flattened into a disk. The center of the disk became the Sun. The rest of the disk became the planets, moons, and asteroids that make up the Solar System.
